SOP + AI

Invited varun.srivatsan@mutares.com Floris Wyers Sanchay Roy

Attachments  SOP + AI

Summary

The team aligned on an AI-driven Sales and Operations Planning strategy through prototype refinement and design simplification.

Defining Strategy and Scope

The team established the goal of creating an AI-enabled Sales and Operations Planning mockup to demonstrate scalable benefits for portfolio companies. Consensus was reached to prioritize executive buy-in over immediate technical development.

Standardizing Data and Design

The group decided to implement rigid data templates to ensure high quality and simplified the interface to focus on essential dashboards. This shift emphasizes accessibility for non-expert users.

Technical Modules and Prototypes

The team defined the core demand, supply, and capacity modules required for actionable decision-making. Future development will focus on consolidating these elements into a streamlined, persistent prototype.

Decisions

Aligned

- **Backwards development strategy adopted** The development strategy for the SNOP tool is set to a "backwards" approach, prioritizing the definition of key outputs and standardized data templates before addressing technical backend complexity.
- **Core module functionality prioritized** The tool scope is restricted to three core modules—Demand, Supply, and Capacity—to ensure a focused and impactful presentation for leadership, rather than adding extraneous dashboards.
- **Dynamic tool architecture shift** The technical approach is set to transition from static, snapshot-based files to a dynamic, chat-enabled backend to allow for persistent data storage and enhanced user interaction.

We've **updated the Decisions section** using your feedback.

Let us know what you think: [Helpful](#) or [Not Helpful](#)

Next steps

- ☐ [D S] Fix Demo Upload: Restore the file upload functionality for data management in the demo application.
- ☐ [D S] Share Source Codes: Provide the source codes for the two developed demo tools to Floris Wyers.
- ☐ [Floris Wyers] Build Prototype Tool: Develop a new prototype tool incorporating a real database, user login, and file management system.
- ☐ [varun srivatsan, D S] Meet COO: Present the current demo version to the Chief Operating Officer to obtain formal project approval.
- ☐ [Floris Wyers] Build Demo Tool: Create a dynamic version of the supply chain planning tool with a backend and chatbot. Host this version on an online server for accessibility by this evening.

- ☐ [varun srivatsan, D S] Consolidate Demo Files: Collect all relevant project files including HTML and TSX exports plus sample data. Group these assets into a single zip folder or SharePoint repository.
- ☐ [varun srivatsan, D S] Share Project Assets: Send the consolidated demo materials to the technical team after the 5 o'clock sanity check meeting. Include notes highlighting the specific features to showcase in the presentation.

Details

Did the screenshots in this section make your notes [better](#) or [worse](#)?

- **Context and Objective for Sales and Operations Planning Initiative:** varun srivatsan explained that the Chief Operating Officer of Mutarus requested an AI-driven Sales and Operations Planning (SNOP) strategy for an upcoming offsite meeting for portfolio companies. The core problem is the lack of a standardized, effective Sales and Operations Planning process across smaller portfolio companies, which previously struggled with the high price points and complex requirements of existing tools. The objective is to create an elevator pitch and mockup solution to demonstrate to portfolio CEOs that a streamlined, AI-enabled Sales and Operations Planning process can be immediately beneficial and scalable.
- **Presentation Strategy and Expectations:** D S clarified that the goal for the upcoming presentation is to show a mockup version of an application that demonstrates the potential of the tool without needing fully developed logic. varun srivatsan noted that they anticipate questions from leadership regarding the cost of such a solution, whether it is implemented internally or externally, and the necessity of professional support to transform the mockup into a functional tool. The group reached a consensus to focus on securing leadership buy-in first before determining the full technical development path.
- **Approach to Data Quality and Governance:** Floris Wyers advised against trying to build a tool that programmatically accepts messy, unstructured data from multiple sources. Instead, the group discussed a methodology of working backward: identifying the five most important elements or key performance indicators needed for a monthly snapshot and creating rigid data templates that portfolio companies must adhere to. This approach ensures data quality and shifts the responsibility for data hygiene to the data owners rather than the

developers, preventing the tool from becoming overwhelmed by non-standardized inputs.

- **Refining the Primary Objectives of the Sales and Operations Planning Tool:** varun srivatsan clarified that the priority is not consolidating data at the corporate level, but rather enabling individual portfolio companies to adopt disciplined and standardized Sales and Operations Planning processes. While data integration and enterprise resource planning connections are necessary long-term steps, the immediate focus is to present actionable dashboards that show key metrics such as revenue projections, inventory status, and forecast accuracy to drive decision-making.
- **Technical Modules of the Sales and Operations Planning Solution:** varun srivatsan outlined the three essential modules for the solution: the Demand module (focusing on unconstrained forecasts, revenue projections, and forecast bias), the Supply module (covering constraint demand plans and Material Requirements Planning), and the Capacity module (analyzing machine capacity and production schedules). Sanchay Roy agreed that these elements are critical and should provide leadership with clear, actionable insights for decision-making regarding inventory risks or production adjustments.
- **Review of Prototype Demonstrations:** D S presented two different prototype versions of the application created using AI tools. The first version featured a comprehensive control tower, demand planning sliders, and scenario workbench capabilities, while the second version offered a multi-site configuration and an action tracker. D S noted that while impressive, these prototypes were missing key elements such as demand variation analysis and lacked consistent data management features, which would be necessary for a full production-ready tool.

- **Optimization and Simplification:** Floris Wyers expressed concern that the current prototypes contained excessive tabs and complexity, which could reduce user adoption. Floris Wyers recommended trimming the interface down to four essential, actionable buttons and focusing on impactful dashboards rather than a massive feature list. The group agreed that the goal is to make the process accessible and understandable for non-experts, ensuring the tool is not just fancy but also explainable.

- Next Steps and Development Timeline:** The group agreed on a deadline for Thursday's presentation. To prepare, D S and varun srivatsan will compile and share the source code and data structures for the prototypes in a zip file. Floris Wyers committed to taking these materials, sanitizing the data, and building an improved, persistent version of the tool by the evening, incorporating an AI chatbot and a standardized backend. This collaborative effort aims to provide a fast, agile, and effective demo for the upcoming leadership pitch.
